ICANN 52 Enhanced By Bosch Systems

DCN Multimedia Systems in the main meeting rooms

SINGAPORE: The Internet Corporation for Assigned Names and Numbers (ICANN) recently held its 52nd Public Meeting at the Raffles City Convention Centre in Singapore, from February 9th to 12th.

ICANN aims to ensure a stable, secure and unified global Internet. In keeping with the organisation's mission, ICANN 52 brought together stakeholders from around the world to discuss what the future of the internet may look like, in light of last year's announcement that the United States (U.S.) government will transition stewardship of the Internet Assigned Numbers Authority (IANA) functions to the global multi-stakeholder community. The meeting also aimed to present the various proposed changes to the public and gain feedback from Internet users around the world.

As a rental partner of Bosch and experts in congress equipment hire, The Congress Rental Network (CRN) has been ICANN's go-to AV supplier for nearly a decade. Spearheading the team in Singapore and Australia, Managing Director, Jeremy Ducklin personally flew in from his base in Australia and partnered with ETG Pte Ltd for AV support to ensure the event ran smoothly

With delicate details to be discussed, Ducklin specified Bosch's DCN Multimedia Conference System for the main stakeholder meetings.

The DCN multimedia system integrates audio, video and meeting content with internet access in one single system. Through it, documents can be shared, presentations retrieved and displayed, and the Internet accessed using multimedia conference devices with high-resolution touch-screens.

"Now that the new DCN Multimedia System is not just audio, but visual as well, it has distinguished us greatly from the competition," shared Ducklin. "The set-up is more complicated which leads many suppliers to avoid the challenge but these systems are market leaders. Since we started using it, we've knocked top companies off their game. While many are still using analog systems, we've now added the element of going digital complemented by video as well."

Needing to cater to various nationalities and languages, Ducklin employed the use of the DCN Next Generation (NG) Interpretation Systems for conferences open to the public.

As an upgrade to the world's first digital congress interpretation system, the DCN NG system brings the benefits of innovative digital technology to interpretation systems. By daisy chaining the modular DCN NG Interpreter and language channel selector units, any configuration can be put together. The modular structure of the system allows for any level of conferencing to be created. Furthermore, systems can be easily expanded by adding components and PC control with software modules.

The new functions combined with the innovation of Bosch are what has led Ducklin to rely on the renowned manufacturer for years.

"We are one-hundred percent dedicated to Bosch systems. We've used various generations of the DCN systems and of course, we would use the latest. In the interpretation aspect, and many others, Bosch leads the way," he said.
